

# HTML5 and CSS3 Complete

Second Edition

Creating Visual Effects and Animation

# Objectives

- Assess responsive design
- Construct a multipart media query
- Test layouts with an emulator
- Add a column with a media query
- Create a widescreen layout
- Create responsive navigation

## Objectives (continued)

- Implement adaptive content
- Use progressive enhancement

# Add Generated Content

## Unit K

- :before and :after pseudo-elements: enable you to insert content into web page using style rules
  - Result known as generated content
  - Can be used for text, pictures, or other content
  - Must specify value for the content property
    - Can be text or path to an image

# Add Generated Content (continued)

- `:before` pseudo-element code and result

```

195 /* label styles */
196 label, .reserveinfo p {
197     font-size: 1em;
198     line-height: 1.6em;
199     font-weight: bold;
200 }
201 label:before, .reserveinfo p:before {
202     content: "* ";
203     color: red;
204 }
205 .additionalinfo label:before {
206     content: "";
207 }

```

The `:before` pseudo-element specifies content displayed before the content specified for an element in its HTML code

Include a space after the asterisk to create white space between the asterisk and the element content

A pair of quotes with no content creates an empty string, which you use to remove any content created in other style rules

Asterisk and space displayed before the content of each `label` element and `p` element as the content of the `:before` pseudo-element

No asterisk or space displayed before `additionalinfo` label because content for `:before` pseudo-element set to an empty string ("")

Name

Email

Start date

Number of days  Number of guests

Other information (hours, catering needs, etc.)

# CSS3 vs HTML version of generated content

HTML way:

```
<p>
<before>* </before> Name: <after>____</after> |
</p>
```

CSS way:

```
p:before {
  content: " * ";
}
p:after {
  content: "____";
}
```

**Note:** content accepts different values.

- none, normal
- <string>
- url()
- Counter(),
- Attr
- Open quote
- Etc...

Output

# Add Generated Content

## Unit K

### Demo: addgenerated.html

#### Mar's Pizza Place - Catering

# Critical Thinking

## Unit K

- Consider a situation in which you have written a web page that includes many paragraphs. You now want to change the display of the web page so that each paragraph ends with an icon. How can you do this with pseudo-elements, without making any changes to the HTML code?

# Add Visual Form Feedback

## Unit K

- CSS supports pseudo-classes specifically for use with forms:

pseudo-class	applies to	description
<code>:active</code>	buttons (button elements or input elements with type value of button, reset, or submit)	the element is in the process of being clicked or otherwise activated
<code>:checked</code>	check boxes, option buttons, or options in a drop-down list	the element is checked or otherwise selected
<code>:focus</code>	input, select, and textarea elements	the element has the focus
<code>:invalid</code>	input or textarea elements with type or other attributes that limit valid values	the content entered by a user does not meet the rules for the field
<code>:optional</code>	input, select, and textarea elements	the element does not have the required attribute, meaning that user entry in the field is optional
<code>:required</code>	input, select, and textarea elements	the element has the required attribute, meaning that user entry in the field is required
<code>:valid</code>	input or textarea elements with type or other attributes that limit valid values	the content entered by a user meets the rules for the field

# Add Visual Form Feedback (continued)

## Unit K

- Code and result using `:valid` pseudo-class:

```
158 /* field styles */
159 input, textarea {
160     border: 1px solid #ccc;
161     padding: 0.2em;
162     font-size: 1em;
163     display: block;
164 }
165 input:valid {
166     background-color: #d1f4bd;
167 }
168 input:focus, textarea:focus {
169     background-color: #cce5ef;
170 }
```

The `:valid` pseudo-class applies to form elements with user input that meets the rules for the field

The `:focus` pseudo-class applies to the element that currently has the focus

The background color for each field changes to the green color specified with the `:valid` pseudo-class when the value entered meets the rules for the field

Faduma Egal

\* Email  
faduma@example.com

\* Start date  
January 1 2019

\* Number of days  
5

\* Number of guests  
15

# Add Visual Form Feedback (continued)

- Code and result using `:focus` pseudo-class:

```
158 /* field styles */
159 input, textarea {
160     border: 1px solid #ccc;
161     padding: 0.2em;
162     font-size: 1em;
163     display: block;
164 }
165 input:valid {
166     background-color: #d1f4bd;
167 }
168 input:focus, textarea:focus {
169     background-color: #cce5ef;
170 }
```

The `:valid` pseudo-class applies to form elements with user input that meets the rules for the field

The `:focus` pseudo-class applies to the element that currently has the focus

The background color for a text box or text area changes to the blue color specified with the `:focus` pseudo-class when the field has the focus

# Create a Gradient

## Unit K

- **gradient**: a visual effect in which an area starts as a single color on one edge/corner and transitions to one or more other colors
  - Modern browsers support gradients as backgrounds
  - Use the `linear-gradient` keyword with values describing the gradient

# Create a Gradient (continued) **Unit K**

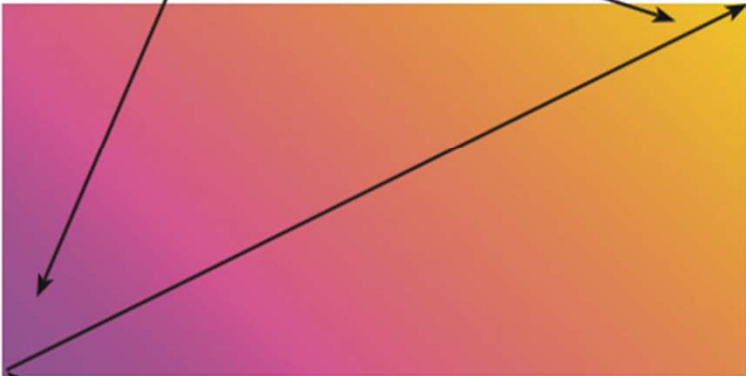

- Examples of linear gradients:

**Two-color gradient at 45°**  
`background-image: linear-gradient(45deg, #d823c5, #edd010);`

The first color stop (0%, the default when not specified) identifies the starting color

The final color stop (100%, the default when not specified) identifies the ending color

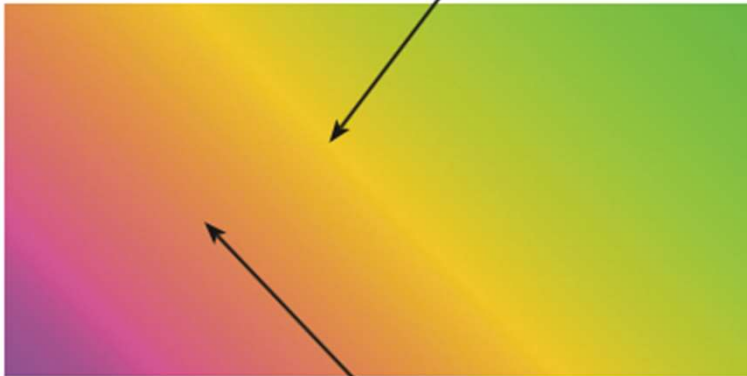

Because of the way gradient angles are defined, a 45° angle creates a gradient that starts at the bottom left corner and ends at the top right corner

A rectangular box showing a two-color linear gradient at a 45-degree angle. The gradient starts with a purple color at the bottom-left corner and transitions to an orange color at the top-right corner. Arrows point from the text boxes to the corresponding corners and the gradient itself.

**Three-color gradient at 45°**  
`background-image: linear-gradient(45deg, #d823c5, #edd010 50%, #2dc30a);`

The middle color stop specifies an intermediate color, along with its position within the gradient

Two adjacent colors are gradually transitioned, creating a gradient

A rectangular box showing a three-color linear gradient at a 45-degree angle. The gradient starts with a purple color at the bottom-left corner, transitions through a yellow color at the 50% mark, and ends with a green color at the top-right corner. Arrows point from the text boxes to the gradient and the transition points.

# Create a Gradient (continued) **Unit K**

- Gradient applied to page background:

```
29  /* document-wide styles */
30  body {
31      margin: 0 auto;
32      font-family: Arial, Helvetica, sans-serif;
33      background: #7eccec;
34      background: linear-gradient(#7eccec, white) no-repeat;
35  }
```

Page background  
gradient starts as  
sky blue at the top  
and ends as white  
at the bottom

# Application Type: Using Gradient

## Weather Maps

Unit K

## Quick Quiz

- (T/F) You use the background-color property to specify a gradient.
- (T/F) You specify a gradient with the linear-gradient keyword.

**Please read your book :>)**

# Create a CSS Shape

## Unit K

- Can use CSS properties to change shapes of HTML elements
  - Enhance visual design
  - Replace shapes that would otherwise require an image file, reducing page size

# Make CSS shapes

## Unit K

Triangle

Circle

Oval

```
</style>

.triangle{
  height: 0px;
  width: 0px;
  border-left: 100px solid transparent;
  border-right: 100px solid transparent;
  border-bottom: 200px solid #428bca;
}

.circle{
  width: 200px; height: 200px;
  background: red;
  border-radius: 100px; /*make it circle*/
}

.oval{
  width: 200px; height: 100px;
  background: green;
  border-radius: 100px / 50px;
}

</style>

<p> Triangle</p>
<div class="triangle"></div>
<br><br>
<p> Circle </p>
<div class="circle"></div>
<p> Oval </p>
<div class="oval"></div>
```

# Create a CSS Shape (continued)

- CSS circle code and result:

```
42 .background-art {  
43   position: absolute;  
44 }  
45 .sun-shape {  
46   width: 200px;  
47   height: 200px;  
48   background-color: rgb(253,148,42);  
49   border-radius: 50%;  
50   position: absolute;  
51   left: -80px;  
52   top: -80px;  
53   z-index: -2;  
54   box-shadow: 0 0 25px rgb(254,230,55),  
55               0 0 50px rgb(254,230,55) inset;  
56 }
```

Minimal properties needed to create a circle using CSS

Additional declarations to change the appearance of the circle

Circle created using a div element and the border-radius property, and positioned partly off of the web page

# CSS Shapes Demo

## cssshapes.html

Unit K

The screenshot shows a web browser window with the address bar displaying a file path. The page content is a form for requesting a quote for Mar's Bed and Breakfast. The form includes fields for Name, Email, Start date (with month, day, and year dropdowns), Number of days, Number of guests, and a text area for other information. A Submit button is at the bottom. A footer contains the address and phone number.

file:///D:/OneDrive/Schools/ITU/ITU\_HTML\_Fall2017/week10/Unit%20K

To see favorites here, select  then , and drag to the Favorites Bar folder. Or import from another browser. [Import favorites](#)

# Critical Thinking: making shapes. Makingcssshapes.html

Unit K

What are the drawbacks of using CSS shapes? How would make the decision whether or not to use one.

```
1 <style>
2 .sun-shape {
3   width: 200px;
4   height: 200px;
5   background-color: rgb(253,148,42);
6   border-radius: 50%;
7   position: absolute;
8   left: -80px;
9   top: -80px;
10  box-shadow: 0 0 25px rgb(254,230,55),
11             0 0 50px rgb(254,230,55) inset;
12 }
13
14 .full-sun-shape {
15   width: 200px;
16   height: 200px;
17   background-color: rgb(253,148,42);
18   border-radius: 50%;
19   position: absolute;
20   left: 80px;
21   top: 80px;
22   box-shadow: 0 0 25px rgb(254,230,55),
23             0 0 50px rgb(254,230,55) inset;
24 }
25
26
27 </style>
28
29 <div class="sun-shape"></div>
30
31 <div class="full-sun-shape"></div>
```

## Apply Styles Based on Feature Detection

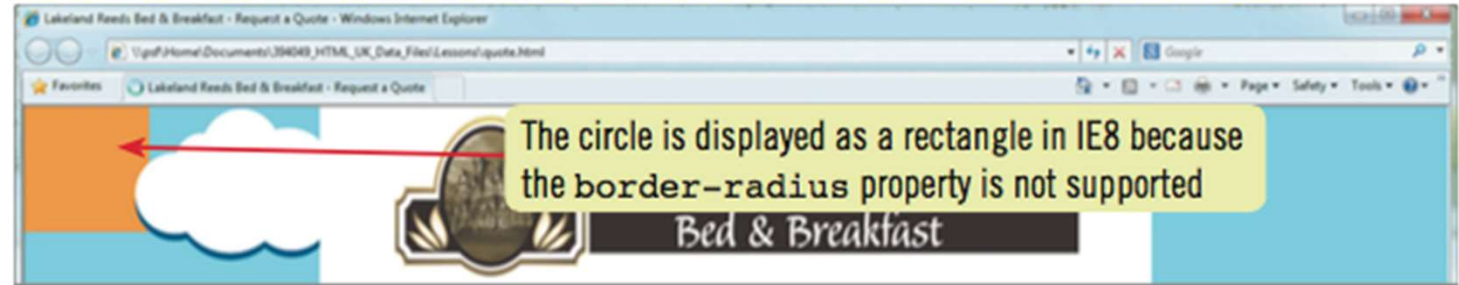

### Unit K

- Newer styles not recognized by older browsers (like IE8)
- **Graceful degradation**: when a site uses newer styles in modern browsers while displaying useable layout and all page content in older browsers
  - Modernizr is a free script library that helps with this process
  - **Feature detection**: process of detecting which properties a browser supports

# Apply Styles Based on Feature Detection (continued)

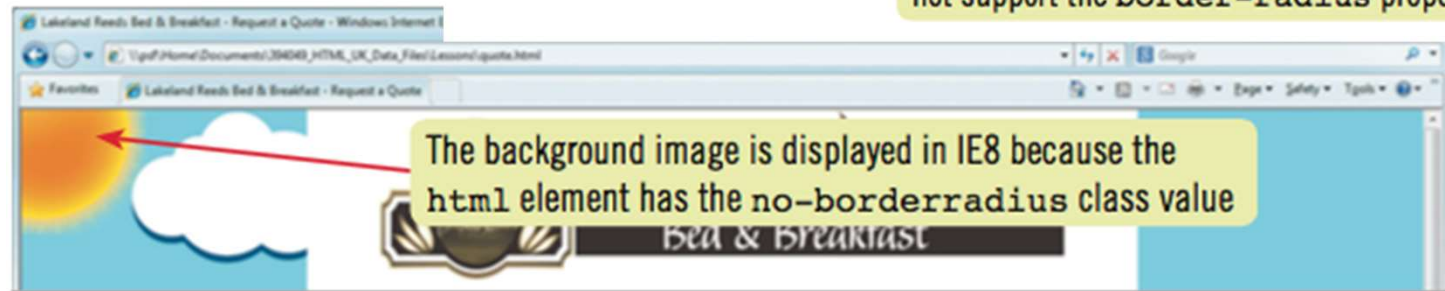

## Unit K

- Feature detection code and results:

```
57 .no-borderradius .sun-shape {  
58     background: url("images/sun.png");  
59 }  
60 .cloud-image {
```

Modernizr adds the no-borderradius class value to the html element in browsers that do not support the border-radius property

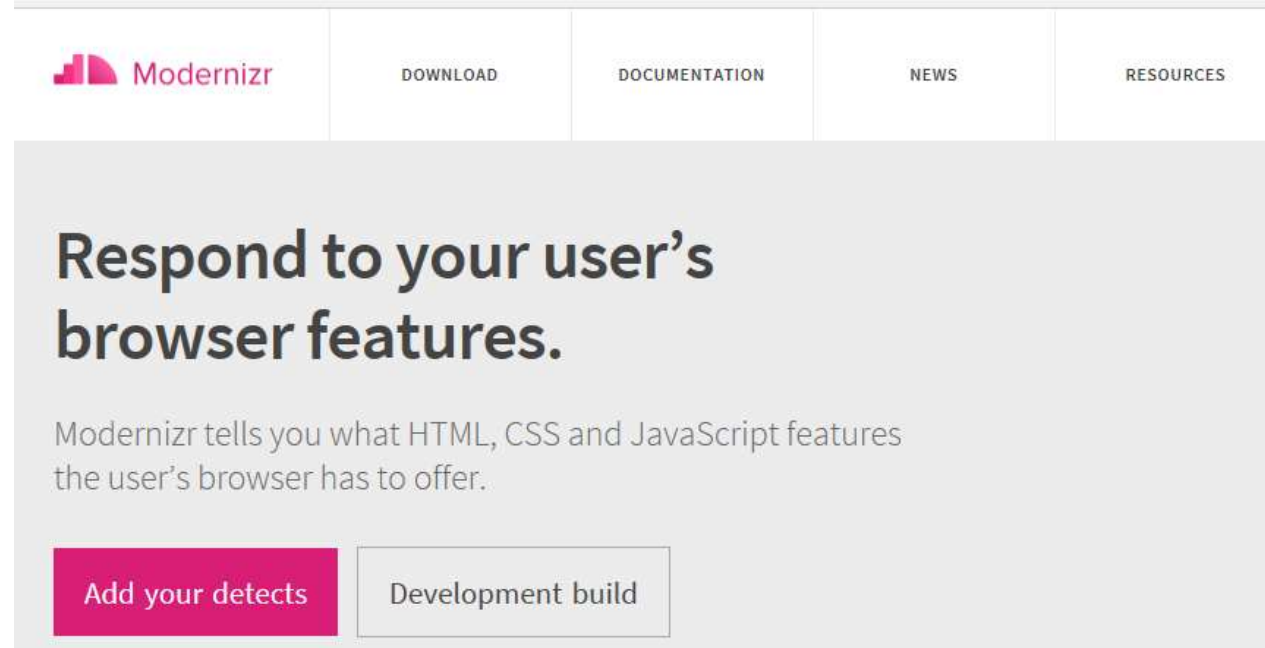

```
<head>  
  <meta charset="utf-8">  
  <meta name="viewport" content="width=device-width">  
  <script src="featuredetection.custom.28018.js"></script>  
  <link rel="stylesheet" href="featuredetection.css">  
</head>
```

# Differences between browser Sniffing vs Feature detection

- **Browser sniffing** – identify the brand and version of each user's browser.
- **Feature Detection** (Modernizr) – runs a series of test the browser supports.
  - - More reliable.

# Customizing and downloading the Modernizr library

- Free for download from modernizr.com
- Used for building and testing website.

## Quick Quiz

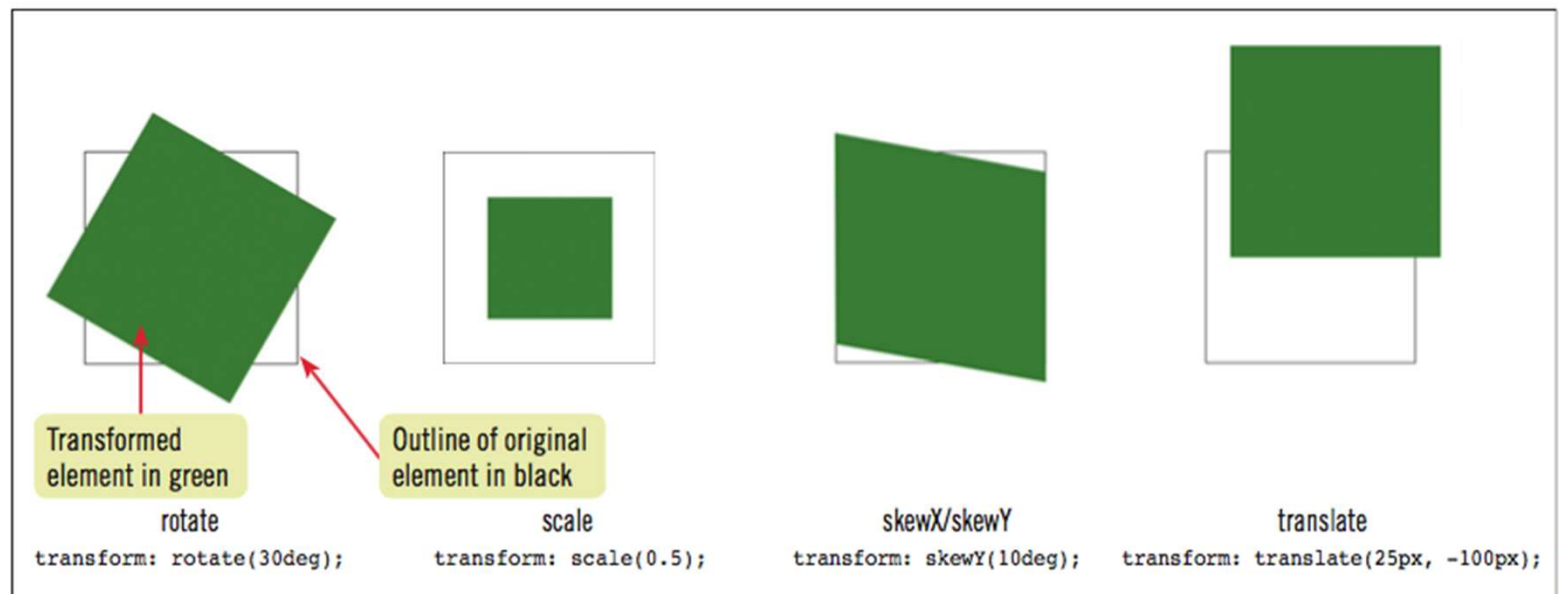

## Unit K

- a. T/F: Modernizr automatically creates the alternative code required for each browser that does not support certain properties.
- b. T/F: Modernizr creates class names that enable a browser to automatically skip style rules that cannot be implemented by the browser.

# Apply a Transform

- **transform**: a change in the appearance of an element in one or more specific ways: rotating, scaling, skewing, and moving (translating)

# Transformation

transform.html

Unit K

```
.prof {
  transform: rotate(20deg);
}
.mar {
  transform: rotate(-55deg);
}
.castro {
  transform: rotate(360deg);
}
</style>

<div class="original">
  <div class="spin">
    <figure class="spinme prof">Prof.</figure>
  </div>
</div>

<div><p> ---- </p><div>
  <div class="original">
    <div class="spin">
      <figure class="spinme mar">Mar</figure>
    </div>
  </div>
<div><p> ---- </p><div>
  <div class="original">
    <div class="spin">
      <figure class="spinme castro">Castro</figure>
    </div>
  </div>
</div>
```

- Implemented in modern browsers with **browser prefixes**
  - Words or abbreviations added to start of property name and specific one or more browsers or rendering engines
- Create declaration using unprefixed form, then precede with declarations using all browser prefixes

# Apply a Transform (continued)

## DEMO: nav.html

### Unit K

- Transform code and result:

```
112 nav.sitenavigation li:hover {  
113     background-color: #34180f;  
114     -ms-transform: scale(1.2);  
115     -webkit-transform: scale(1.2);  
116     transform: scale(1.2);  
117 }
```

Prefixed properties included  
before declaration using  
unprefixed property name

# The CSS browser prefixes

## Unit K

You can use the following browser prefixes which are specific to each browser:

- Android: `-webkit-`
- Chrome: `-webkit-`
- Firefox: `-moz-`
- Internet Explorer: `-ms-`
- iOS: `-webkit-`
- Opera: `-o-`
- Safari: `-webkit-`

```
.cloud-image {  
  max-width: none;  
  display: block;  
  position: absolute;  
  left: 100px;  
  z-index: -1;  
  -webkit-animation-duration: 3s;  
  animation-duration: 3s;  
  -webkit-animation-timing-function: linear;  
  animation-timing-function: linear;  
  -webkit-animation-name: reveal-sun;  
  animation-name: reveal-sun;  
}
```

# Webkit Demo: webprefixes.html

```
.cloud-image {  
  max-width: none;  
  display: block;  
  position: absolute;  
  left: 100px;  
  z-index: -1;  
  -webkit-animation-duration: 1s; /*speed */  
  animation-duration: 1s; /*speed */  
  -webkit-animation-timing-function: linear;  
  animation-timing-function: linear;  
  -webkit-animation-name: reveal-sun;  
  animation-name: reveal-sun;  
}
```

It is considered good practice to specify the vendor-prefixed version first and then the non-prefixed version, in order that the non-prefixed property will override the vendor-prefixed property-settings once it's implemented

## Mar's Bed & Breakfast - Request a Quote

\* indicates a required field

# Create a Transition

- **transitions**: CSS features that gradually apply changes to properties in response to user actions
  - Supported by modern browsers
  - Create simple animations
  - Example: create transform to rotate an element, then use transition to spin element into position over several seconds

# Create a Transition (continued)

## Unit K

- Aspects of transitions that are configurable:

property	description	example
transition-delay	time in seconds after a transition is triggered and before the transition begins	<code>transition-delay: 5s;</code>
transition-duration	time in seconds from the start of transition to the end of transition	<code>transition-duration: 3s;</code>
transition-property	the name(s) of one or more properties to be transitioned	<code>transition-property: transform;</code>
transition-timing-function	a function expression or keyword that determines the rhythm of the animation; commonly used keywords include <code>ease</code> , <code>ease-in</code> , <code>ease-in-out</code> , <code>ease-out</code> , <code>linear</code> , <code>step-end</code> , and <code>step-start</code>	<code>transition-timing-function: ease-in;</code>
transition	shorthand property that takes space-separated values in the order <i>property duration timing-function delay</i> ; values for multiple properties can be specified, separated by spaces	<code>transition: transform 3s ease-in 5s;</code>

# Create a Transition (continued)

## Demo nav.html

Unit K

- Transition code and result:

```
104  nav.sitenavigation li {  
105      margin: 0.3em 0.5em;  
106      padding: 0.2em 0.4em;  
107      display: inline-block;  
108      font-size: 1.3em;  
109      line-height: 1.4em;  
110      border-radius: 10px;  
111      -webkit-transition-duration: 0.2s;  
112      transition-duration: 0.2s;  
113      -webkit-transition-timing-function: ease-in;  
114      transition-timing-function: ease-in;  
115  }  
116  nav.sitenavigation li:hover {  
117      background-color: #34180f;  
118      -ms-transform: scale(1.2);  
119      -webkit-transform: scale(1.2);  
120      transform: scale(1.2);  
121  }
```

The `-webkit-transition-duration` and `transition-duration` properties set how long the transition takes

The `-webkit-transition-timing-function` and `transition-timing-function` properties determine how the transition is applied

The transition applies to all properties with values that change in response to user interaction

- **keyframe animation**: an animation created using animation properties and the `@keyframes` rule
  - Supported by modern browsers
  - Enable you to control what animation looks like at various points between start and end
  - `@keyframes` rule: name for rule, followed by nested rules in braces, with percentage selectors

- Animation-related CSS properties:

property	description
<code>animation-delay</code>	time in seconds after an animation is triggered and before the animation begins
<code>animation-direction</code>	whether the animation should play forward (normal) or in reverse (reverse)
<code>animation-duration</code>	time in seconds from the start of animation to the end of animation
<code>animation-iteration-count</code>	number of times the animation is played
<code>animation-name</code>	the name of the @keyframe rule to use
<code>animation-timing-function</code>	a function expression or keyword that determines the rhythm of the animation; commonly used keywords include ease, ease-in, ease-in-out, ease-out, linear, step-end, and step-start
<code>animation</code>	shorthand property that takes space-separated values in the order <i>name duration timing-function delay iteration-count direction</i>

# Animate Content (continued)

## Demo: webprefixes.html

- Components of keyframe animation:

```
67 @-webkit-keyframes reveal-sun {
68   0% {
69     left: -150px;
70   }
71   50% {
72     left: -50px;
73   }
74   100% {
75     left: 100px;
76   }
77 }
```

@-webkit-keyframes rule

The @-webkit-keyframes rule is required by Chrome, Safari, Opera, and Android Browser

The content of the @-webkit-keyframes rule is identical to that of the @keyframes rule

```
78 @keyframes reveal-sun {
79   0% {
80     left: -150px;
81   }
82   50% {
83     left: -50px;
84   }
85   100% {
86     left: 100px;
87   }
88 }
```

@keyframes rule

The name is any string you choose to identify the animation

The declarations in each percentage rule specify the state of the element at that point in the animation

```
60 .cloud-image {
61   max-width: 100px;
62   display: block;
63   position: absolute;
64   left: 100px;
65   z-index: -1;
66   -webkit-animation-duration: 3s;
67   animation-duration: 3s;
68   -webkit-animation-timing-function: linear;
69   animation-timing-function: linear;
70   -webkit-animation-name: reveal-sun;
71   animation-name: reveal-sun;
72 }
```

The content of each -webkit-prefixed declaration is the same as its corresponding unprefixed property

The animation-duration property specifies the time the animation takes from start to finish

The animation-timing-function value is a keyword for the rhythm of the animation

The animation-name declaration references the name specified in the corresponding @keyframes rule

# Summary

- The `:before` and `:after` pseudo-elements enable you to insert content -- known as generated content -- into web pages using style rules.
- CSS supports several pseudo-classes specifically for use with forms, which you can use to change properties in forms in response to user actions.

## Summary (continued)

- A gradient is a visual effect in which an area starts as a single color on one edge or corner and transitions gradually to one or more other colors.
- You can use CSS properties to change the shapes of HTML elements to enhance your visual design.

## Summary (continued)

- You can use Modernizr to implement graceful degradation, which describes a layout that uses newer styles in modern browsers while displaying a usable layout and all page content in older browsers.
- A transform is a change in the appearance of an element in one or more specific ways (rotating, scaling, skewing, or moving).

# Summary (continued)

## Unit K

- Transitions are CSS features that gradually apply changes to properties in response to user actions over a number of seconds.
- A keyframe animation uses animation properties and the `@keyframes` rule and enables you to control what the animation looks like at various points between the start and end.
